ProNex-ArchAI

Unified Master Product Requirements & Functional Specification

Consolidated requirements baseline | 12 October 2026

Document Control

Item	Finalized baseline
Purpose	Single consolidated business and functional requirements document for the ProNex-ArchAI studio portal.
Audience	Studio principals, product/design team, implementation team, QA and future maintainers.
Status	Consolidated requirements baseline. NAS, backend, database, hosting and deployment architecture are intentionally not selected in this document.
Date	12 October 2026
Scope	Responsive web application / installable PWA for desktop, tablet and mobile.
Commercial model	One independent deployment per architecture firm; no cross-firm data sharing in V1.

How to Use This Specification

This document consolidates the supplied master specification and decisions made during requirements review. Where the source conflicted with a later explicit decision, the later decision is treated as authoritative. Low-impact operational rules are standardized here to keep the experience predictable. Infrastructure choices are deliberately deferred until the business requirements are agreed.

Contents

- 1. Product vision and scope
- 2. Roles, project assignment and access model
- 3. User creation, credentials and authentication
- 4. Project lifecycle and standard folder structure
- 5. Document vault, file governance and permissions
- 6. Design verification and approved drawing replacement
- 7. Meetings
- 8. Payments and pricing visibility
- 9. Announcements and policies
- 10. Progress reports and targets
- 11. Attendance and daily work updates
- 12. Project chats and admin reminders
- 13. Notifications and security
- 14. Role/module access matrix
- 15. Admin settings, auditability and non-functional requirements
- Appendix A. Fixed project folder structure

1. Product Vision and Scope

ProNex-ArchAI is a professional collaboration portal for architecture and interior-design studios. It connects studio administrators, staff and client-side users through project documents, design review, meetings, progress visibility, payment records, attendance, targets, announcements and policies.

- Provide a premium, uncluttered, responsive user experience across desktop, tablet and mobile.
- Support an installable PWA experience; keep navigation and screens role-aware and simple.
- Use a separate deployment for each firm, with that firm’s own branding, users, projects, files and settings.
- Do not build multi-tenant data sharing between firms in V1.
- No custom roles in V1; the four active roles are Admin, Staff, Client Leader and Client Viewer.

- The product requirements in this document do not decide whether original files live in cloud storage or on an office NAS. That decision is reserved for a later architecture discussion.

2. Roles, Project Assignment and Access Model

2.1 Roles

Role	Purpose and key permissions
Admin	All Admin accounts have equal authority and full access to the entire application and every project, including governance, user management, files, payments, approvals, attendance records and reports. V1 supports four Admin accounts.
Staff	By default, has access to all active projects. Admin can remove Staff access from any individual project. Staff can submit design verification drawings, attendance and daily work updates, and work on assigned targets. Staff never sees project pricing or payments.
Client Leader	Can be assigned to one or multiple projects. Can access project documents according to project/folder permissions, request meetings, use the project chat, view progress, and see pricing/payment details only when enabled for that project.
Client Viewer	Can be assigned to one or multiple projects. Can view project documents according to permissions, view progress read-only, and read announcements/policies. Cannot use project chat or book meetings.

2.2 Admin Access

- All four Admin accounts are equal; no separate Super Admin role exists in V1.
- Every Admin has full system access and full access to all projects, including inactive-project administration.
- All Admin-targeted operational notifications go to all active Admin accounts.
- The system must never allow the last active Admin to be deactivated. An Admin may deactivate another Admin only if at least one active Admin will remain.

2.3 Project Assignment Rules

- Admin: all projects automatically; no project assignment is required.
- Staff: all active projects are selected by default when the Staff user is created. Admin can remove a Staff member from one or more individual projects. Removing access takes effect immediately; existing work updates, attendance, submissions and activity history remain.
- Client Leader: Admin can select one or more projects during user creation or later editing. Multiple Client Leaders may be assigned to the same project; each has an individual account and identity.
- Client Viewer: Admin can select one or more projects during user creation or later editing. Viewer identities are individual even though the login username/password is shared per project.
- Project assignment and folder-level access permissions are separate concepts: assignment determines which project is accessible; project/folder rules determine what a client can view or download.
- Removing a client from one project immediately blocks that project only. Other project assignments remain unchanged. Historical records retain the original person’s name and role.
- A project may be created without any client assignments. Unassigned clients have no access.

2.4 Account Deactivation

- Deactivation immediately blocks new login and revokes active sessions for that account across all projects.
- Historical records retain the original user’s name and role; do not replace them with a generic ‘Deactivated User’ label.
- An Admin can reactivate the account. Previous project assignments and current permissions apply again, subject to project status.
- Deactivating a Staff account does not require transferring projects first; existing records remain intact.

3. User Creation, Credentials and Authentication

3.1 User Creation Fields

Field	Rule
Role	Required: Admin, Staff, Client Leader or Client Viewer.
Username	A unique username is required after save. Admin may enter one; if left blank, the system generates a unique username.
Full name	Required for all human users. Use the real display name in normal UI.
WhatsApp/mobile number	Required for Client Leader and Client Viewer OTP identity verification. Recommended for Staff/Admin if used for account recovery or delivery.
Email	Optional unless a configured account invitation or recovery process requires it. Email is not part of the app-notification delivery matrix.
Password	Never distribute a permanent password. The user sets their own password through a single-use, time-limited setup link or temporary setup credential.
Assigned projects	Multi-select. Admin: all projects automatically. Staff: all active projects selected by default, with individual project removal available to Admin. Client Leader/Viewer: one or multiple projects can be selected.
Active status	Default Active; Admin can deactivate or reactivate.

3.2 Secure Credential Distribution

- After creating a user, the Admin may share an invitation through WhatsApp, email (if configured) or copy invite details.
- Invite details contain portal URL, username, role and setup-link status only; never include a raw permanent password.
- Setup links are single-use and expire after a limited period. The user sets their own password. The password is never shown again in the UI.
- The same rule applies to the first/seed Admin account: provision it manually, but have the Admin set their own password through a secure setup/reset flow.
- Credential copy actions must not copy passwords, OTPs or other secrets.

3.3 Admin and Staff Login

Admin and Staff sign in with username and password. Sessions may persist for usability, but must have a defined expiry and be revocable. Account deactivation, password reset and security events must revoke affected sessions. Do not implement an unlimited, non-expiring session.

3.4 Client Leader Login

- Client Leader enters full name, WhatsApp mobile, username and password; the identity fields must match the stored account.
- Password verification must use the authentication system’s secure password verification, not plaintext password comparison.
- WhatsApp OTP is required for login.
- The `Client Leader Access Approval Required` setting is independent of Viewer approval. If ON, the user requests access and waits for Admin approval after identity verification; if OFF, successful identity/password verification plus OTP grants access.
- Every new login follows the current approval and OTP policy. Existing valid sessions may remain until logout, expiry or revocation.

3.5 Client Viewer Login

- Each project has its own shared Viewer username/password credentials, while every Viewer registers an individual full name and mobile number. A Viewer identity may be assigned to one or multiple projects. When entering a project

that uses shared credentials, the Viewer must supply that project's shared credentials plus OTP to the individual's registered mobile; the system must never let shared credentials alone impersonate another Viewer. The user sees only projects assigned to that individual identity.

- One mobile number cannot register two separate Viewer identities within the same firm deployment.
- Every new Viewer login requires the project's shared username/password plus OTP to that individual Viewer's registered mobile. Shared credentials alone must never impersonate another Viewer.
- The `Client Viewer Approval Required` setting is independent of Client Leader approval. If ON, Admin approval is required; if OFF, access is granted after the shared credentials and personal OTP are verified.
- No OTP-less login or remember-me bypass for a new Viewer login. A valid session may remain active until logout, expiry or revocation; opening the app within that valid session is not a new login.
- Viewer access is restricted to projects to which that Viewer identity is assigned and to active projects only.

3.6 Display and Audit Identity

- Normal navigation, header and welcome screens show the user's full name only, without role in parentheses.
- Audit/activity records show actor name, role, action and timestamp.

4. Project Lifecycle and Standard Folder Structure

Each project card displays Project Code (e.g., LAP, ART, CRF), Project Name, Category (e.g., Luxury Villa, Boutique Hotel, Commercial), Site Location, Status and Completion %. Project finance fields include Total Project Agreed Fee and Advance Payment Received; pricing visibility is role- and project-configurable, and Staff must never see pricing.
The document explorer supports two switchable views: (1) an interactive tree/category view with expandable and collapsible folders, and (2) a grid/card view with thumbnails, file size, sheet number, revision metadata where applicable, and last-updated date.

4.1 Project Card Information and Explorer Views

4.2 Project Creation

- Admin can create projects and manage project metadata, assignments, pricing visibility and document permissions.
- A project can be created without client assignments; clients can be assigned later.
- Every new project automatically receives the same fixed folder structure: two phase groupings containing 6 Concept Design categories and 9 Construction Design categories, plus `03_OTHER`. Exactly 16 categories count toward progress; phase headings are containers and do not count separately. Admin cannot remove or customize the standard folder set in V1.
- There is no project deletion option. A project can only be marked Active or Inactive.

4.3 Inactive Projects

- Inactive projects are hidden from normal project lists for every role, including Admin. Admin accesses them through a separate Inactive Projects filter.
- Admin retains full access. Staff retains read-only access; Staff cannot upload, modify, rename or submit Design Verification for an inactive project.
- Client Leader and Client Viewer cannot see or access inactive projects and receive no notifications about them.
- Project documents, folders, payments, assignments and history remain stored. No permanent project deletion is available.
- Admin can reactivate a project. Prior assignments and permissions are restored, subject to current account status and current permissions.

5. Document Vault, File Governance and Permissions

5.1 Supported File Types

Allowed extensions are controlled by an Admin-configurable whitelist. Required supported formats are:

- .pdf
- .dwg
- .dxf
- .dgn
- .jpg
- .jpeg
- .png
- .webp
- Admin can configure maximum file size in MB and allowed extensions.
- Validation must be enforced by the backend, not only by the browser/UI. Validate file type and size and reject disallowed uploads.
- Supported upload formats do not guarantee native browser preview for every format. Use an appropriate viewer/conversion service where available; otherwise offer the original file download only when the user has download permission.

For `.dwg` files, provide a quick high-resolution browser preview using a derived PDF, vector or image representation where technically feasible, while preserving the original `.dwg` file. Show an `Download Original .DWG` action only when the current user has download permission. A preview representation is not a replacement for the original CAD file.

5.2 Hybrid DWG Preview Strategy

5.3 Client Access Controls

- Admin configures permissions per project, per standard folder/category, and per client role (Client Leader versus Client Viewer). Each setting is View Only or View + Download.
- Default folder permission is View + Download unless Admin restricts it.
- Project-level `Allow Client File Downloads` is a master switch. If it is View Only, it overrides all folder settings and blocks downloads for all client roles.
- The backend must enforce both project assignment and folder/download permissions. Hiding a download button alone is not security.
- For View Only, do not expose a direct original-file download URL. The system cannot guarantee prevention of screenshots or external capture.

5.4 File Classification and Naming

- The 16 fixed folders are the primary classification structure. Upload UI should let authorized users select the intended category where applicable.
- Required source rule: use the naming convention `[ProjectName]_[Category]_[SubCategory]_[FileName]`. If a filename does not follow the required standard, the system automatically routes the file to `03_OTHER`. This rule must be implemented consistently and explained clearly in the upload UI.

6. Design Verification and Approved Drawings

- Design Verification is available only to Admin and Staff; clients cannot access the module.
- Staff uploads a drawing for a project and selects/indicates its intended category. All Admins receive a notification.
- Admin can Approve or Send for Revision with optional feedback.
- On revision, only the latest submission is retained in the active Design Verification workspace; a new submission replaces the prior pending submission. Admin can see a revision counter; Staff cannot.
- Staff sees the current drawing and Admin feedback, but not the revision counter.
- On approval, the drawing is moved/copied into its designated project folder and becomes read-only in Design Verification.
- Only the latest approved drawing is retained as the current approved drawing in the relevant project folder. When a new drawing is approved for that same drawing/category, it replaces the previous current approved drawing; do not present a separate approved-revision history in V1.

- Audit metadata should still record who submitted, reviewed and approved/rejected the current workflow item and when, even though prior drawing files are not retained as a user-facing revision history.

7. Meeting Management

- Roles: Admin and Client Leader. Meeting types: Office Meeting and Site Visit.
- Fixed slots: 12:00–13:30, 16:00–17:30 and 18:00–19:30, using the firm's configured local time zone.
- One booking can occupy a given date/time slot globally; the backend must prevent race conditions and double booking.
- Client Leader submits a request and Admin approval is required. Admin-created bookings notify the relevant Client Leader(s).
- A meeting can be associated with multiple projects. All Admins and relevant Client Leaders are included automatically; there is no individual member selector.
- Past dates cannot be selected. Agenda/notes are optional.
- A client may update and resubmit a request after approval or rejection. When rescheduling an already approved meeting, the old approved booking remains valid until the replacement is approved; a pending reschedule does not cancel the old booking. Recheck availability before approval.

8. Payments and Pricing Visibility

- Admin owns payment entry creation and editing. Client Leader/Viewer can see payment information only if the relevant per-project pricing visibility toggle is enabled.
- Staff never sees project pricing, agreed fees, payment history, receipts or the Payments module.
- Payment entries support milestone/advance amount, payment mode (Cheque, UPI, NEFT/RTGS, Cash), reference number, bank name and receipt attachment where applicable.
- Suggested status meanings: `PENDING_CLEARANCE` = recorded but funds/receipt not yet verified; `CONFIRMED` = Admin has verified the payment; `REVISION_REQUESTED` = a client has raised a discrepancy/correction request and Admin review is pending.
- Clients cannot edit payment entries. They can submit a discrepancy note/correction request. Only Admin can correct the entry; the corrected entry is visible to eligible clients based on the current project pricing settings.
- Record an audit trail for payment creation/correction, including actor, timestamp and changed values. Avoid deleting payment history; corrections should be auditable.

9. Announcements and Policies

9.1 Announcements

- Admin creates and publishes announcements. All users can read announcements targeted to them.
- Audience options: All, Staff, Client Leaders, Client Viewers. Default audience is All.
- Message body is optional; a title and attachment may be sufficient.
- The old Normal Circular and Urgent Protocol type selector is out of scope.
- Show publisher name, role and timestamp.
- Published announcement updates/deletions should be reflected consistently; where a notice is withdrawn, show it as withdrawn or unavailable rather than silently presenting stale content.

9.2 Policies

- Admin manages policies; Staff and all assigned clients can read them.
- No policy category field in V1. One policy can contain multiple PDF and image attachments.
- Policy publication, update, withdrawal or deletion generates a notification to all users. If a policy is replaced, retain enough audit metadata to identify the action and actor.

10. Progress Reports and Targets

10.1 Progress Calculation

- Progress is calculated from 16 counted categories/folders: 6 Concept Design categories, 9 Construction Design categories and `03_OTHER`. The two phase headings are organizational containers and do not count separately. Any file in a category counts for progress; approval status is not a condition.
- A folder/category containing at least one document/file counts as 100%, regardless of whether the file is approved; an empty folder/category counts as 0%.
- Formula: `(number of folders containing documents / 16) × 100`. Example: 12 populated folders out of 16 = 75%.
- Progress reports are available to Admin and assigned Client Leaders/Client Viewers, read-only for clients. Staff does not get a Progress Report screen.
- Send progress notifications only for meaningful changes, not every minor upload-processing event.

10.2 Targets

- Admin can create a target with title, optional description/notes, one or more projects, one or more Staff members and a due date.
- Statuses: Pending, In Progress, Completed, Overdue.
- Staff marks work complete and submits it for Admin review. It becomes Completed only after Admin approval.
- If the due date passes while the target is not completed, it is shown as Overdue. Completing/submitting after the due date does not bypass Admin review.
- Assigned Staff can see and update their target; clients cannot access targets.

11. Attendance and Daily Work Updates

11.1 Attendance

When Staff opens the app, Clock In / Clock Out is the primary visible action so the daily attendance task is easy to find.

- Staff only performs Clock In/Clock Out; Admin can review all Staff attendance. Admin does not punch attendance in V1.
- GPS location is mandatory for both Clock In and Clock Out. Store coordinates and reverse-geocoded address when available. There is no fixed geofence/radius requirement.
- If location permission is denied or location cannot be obtained, the punch cannot complete; show a clear recovery message.
- Prevent duplicate Clock In or Clock Out events for the same active work session. A missed punch or incorrect punch is handled through a regularization request reviewed by Admin.
- Staff can submit leave requests; Admin approves or rejects them. Approved leave should be reflected in attendance views and reminders.
- Keep all attendance actions and corrections auditable.

11.2 Daily Work Updates

Reminder message template: “Action Required: Please submit your scheduled work status update for [Project Name]. Submitting all daily updates is mandatory before end-of-day Clock-Out.”

- Staff submits scheduled work updates; Admin reviews them.
- Admin chooses one trigger mode: Interval Mode (every configured X hours after Clock In) or Fixed Slots Mode (specific configured times).
- Send reminders approximately 10 minutes before each due time.
- Every required update for that day must be submitted before Clock Out. There is no Admin override/exception for this rule in V1; reminders do not change eligibility.
- If a required update is missed, the UI should identify the outstanding update and explain that Clock Out is blocked until it is submitted.

12. Project Chats and Admin Reminders

12.1 Project Chats

- Chat is available only to Admin and Client Leader. Staff and Client Viewer cannot access it.
- Each project has one common thread containing all Admins and all Client Leaders assigned to that project.
- Support text messages and image attachments up to 10 MB per image.
- Only new-message notifications are sent. Do not send unread-message reminder notifications.
- For auditability, sent messages should not be silently editable/deletable by ordinary users. Any moderation/removal capability must preserve audit metadata.

12.2 Admin Reminders

- Admin-only shared reminder tool. Reminders may be general or linked to a project.
- All Admins can see the shared reminders. Staff and clients never see them.

13. Notifications and Security

- Application notification channels: In-app + Push. Do not use email for routine application notifications. Account invitations are a separate optional delivery flow.
- Users cannot disable push notifications inside the application; operating-system/browser permission remains under the device user's control. In-app notifications remain available.
- All Admin-targeted notifications go to all active Admin accounts, not only a project's assigned Admin.
- Project-related notifications go only to active users associated with that project and authorized for the relevant event. Do not notify users who are not assigned to the project.
- Inactive projects stop client notifications. Admin and Staff operational notifications may continue where relevant to their allowed inactive-project access.
- Push delivery retries: initial attempt plus at most three retries, approximately 1, 5 and 15 minutes after the initial attempt, for temporary failures. Avoid duplicate notification records. If push delivery ultimately fails, keep the in-app notification and log the technical failure.
- Provider acceptance does not guarantee that a device displayed the push notification.
- Urgent alerts include security/access alerts, suspicious repeated authentication failures, critical upload/processing failures and critical approval/action-blocking failures.
- Ordinary permission/security configuration changes are audit-log-only; do not notify everyone for routine settings changes.
- Sensitive payment details should not be included in push previews. Use a neutral message directing the eligible user to the secure app screen.
- All protected actions must enforce authorization on the server/backend, not only in the UI.

14. Role / Module Access Matrix

Module	Admin	Staff	Client Leader	Client Viewer
Projects	Full access to all projects	All active projects by default; Admin can remove per-project access; inactive read-only	Assigned active projects only	Assigned active projects only
Project documents	Full	Allowed project access; upload only through workflow as applicable	View/download per project + folder settings	View/download per project + folder settings
Design Verification	Approve / revise / manage	Submit and view current item/feedback	No access	No access
Meetings	Manage / approve / create	No access	Request / view own project meetings	No access
Pricing / Payments	Full	Hidden	Per-project visibility toggle	Per-project visibility toggle
Announcements	Create/manage	Read targeted items	Read targeted items	Read targeted items

Progress report	All projects	No screen	Assigned projects, read-only	Assigned projects, read-only
Attendance	Review all Staff	Clock In/Out, leave and regularization	No access	No access
Daily work updates	Review	Submit required updates	No access	No access
Targets	Create / assign / approve completion	View assigned / submit completion for review	No access	No access
Project chat	All project threads	No access	Threads for assigned projects	No access
Admin reminders	Shared management	No access	No access	No access
Policies	Manage	Read	Read	Read
Settings / governance	Full	No access	No access	No access

15. Admin Settings, Auditability and Non-Functional Requirements

15.1 Admin Settings

- Client Leader Access Approval Required: On/Off.
- Client Viewer Access Approval Required: On/Off.
- Show Pricing to Client Leader: On/Off per project.
- Show Pricing to Client Viewer: On/Off per project.
- Allowed file extensions and maximum file size in MB.
- Per-project client file-download master switch.
- Per-project, per-folder and per-client-role View Only / View + Download settings.
- Daily work-update trigger mode and interval/fixed times.
- Firm branding: firm name, logo, primary and accent colors.

15.2 Audit and Operational Safety

- Record actor, role, timestamp and action for sensitive actions including approvals, payment corrections, permission changes, user deactivation, project status changes and attendance regularization.
- Use server-side authorization checks for every protected read/write/download.
- Prevent duplicate meeting bookings and duplicate push notifications.
- Use secure password handling and time-limited single-use setup links. Never log or display plaintext passwords or OTPs.
- Retain historical records after unassignment, deactivation or project inactivation.
- Show clear, actionable validation errors; do not expose internal stack traces or secrets to users.

Appendix A. Fixed Project Folder Structure

Every project contains a fixed structure with two phase groupings and exactly 16 counted categories/folders: six Concept Design categories, nine Construction Design categories and `03_OTHER`. Folder names should remain stable across projects.

Count	Counted category / folder
01	Concept Design — SITE DRGS — Master site and topographic survey layout
02	Concept Design — ZONING / PLANING — Spatial program and FSI allocation
03	Concept Design — SPACE / OBJECT DESIGN — Interior enclosure and object studies
04	Concept Design — COMPLETE SET OF DRGS — Full architectural schematic package

05	Concept Design — MATERIAL SELECTION — Stone, wood and texture moodboards
06	Concept Design — 3D IMAGES — Photorealistic day and twilight CGI renders
07	Construction Design — CIVIL DRGS — RCC footing, raft and column layouts
08	Construction Design — PLUMBING DRGS — Water supply riser and drainage schematics
09	Construction Design — FIRE DRGS — Hydrant, sprinkler and life-safety plans
10	Construction Design — HVAC DRGS — Chilled-water and ducting routing plans
11	Construction Design — FLOORING DRGS — Marble cutting and tile-laying layouts
12	Construction Design — CEILING DRGS — Reflected ceiling plans and lighting drops
13	Construction Design — ELECTRICAL DRGS — Power single-line diagrams, DB schedules and conduit routes
14	Construction Design — WALL ELEVATION — Internal elevations and façade details
15	Construction Design — ELEMENT DRGS — Stair railings, canopies and joinery details
16	03_OTHER — miscellaneous / unclassified files — Catch-all for unclassified or miscellaneous files

Final counting rule: the Concept Design and Construction Design labels are phase groupings, not additional progress units. Count only the 6 Concept Design categories, 9 Construction Design categories and `03_OTHER` (16 total). Any file in a category counts, regardless of approval status. The agreed example is 12 populated categories out of 16 = 75%.

Appendix B. Consolidation and Decision Notes

This document consolidates the supplied 12 October 2026 master specification and subsequent explicit business decisions discussed in the conversation. Later explicit decisions override conflicting source wording. In particular: no project deletion; four equal Admin accounts with system-wide access; Staff receives all active projects by default but Admin may remove per-project access; Client Leader and Client Viewer support multi-project assignment; secure setup links replace password sharing; progress counts any file in a counted category; and the progress denominator is 16.

Architecture decisions for original file storage, NAS, backend, database, hosting and deployment remain open and are intentionally excluded from this business requirements baseline. This document is a consolidated baseline, not a substitute for implementation QA or a line-by-line sign-off checklist.

Appendix C. User-Facing Templates and Preserved Product Details

C.1 PWA and Visual Foundation

- The application is a responsive installable PWA for desktop, mobile and tablet. The implementation must provide the web app manifest (`manifest.json`) and service-worker support required for installation.
- Preserve the source design direction: minimalist luxury architectural aesthetic, coordinated dark/light studio themes, clean cards, smooth transitions and drill-down navigation.
- The Projects Explorer must provide both an interactive expandable/collapsible tree/category view and a grid/card view. Grid cards may show thumbnail, file size, sheet number, revision metadata where applicable and last-updated date.

C.2 Safe Account Invitation Templates

The original welcome-message intent is retained, but unsafe permanent-password sharing is removed. The user receives the portal URL, username and a secure setup link/status; the user creates their own password.

WhatsApp invitation template:

ProNex-ArchAI | Private Studio Collaboration Portal

Dear [Full Name],

Welcome to your dedicated architectural workspace. Your private studio access is ready for project drawings, design coordination and progress updates.

Portal URL: [Portal URL]
Username: [Username]
Secure password setup: [Single-use setup link]

Please use the secure setup link to create your password. The link expires and can be used only once.

Warm regards,
The Principal Architect & Studio Team

Email invitation template:

Subject: Welcome to Your Private Architectural Workspace — ProNex-ArchAI

Dear [Full Name],

We are pleased to invite you to the ProNex-ArchAI Studio Portal. Your project access has been configured according to your assigned role and projects.

Portal URL: [Portal URL]
Username: [Username]
Secure password setup: [Single-use setup link]

Please create your own password using the secure link. Do not forward the setup link. If it expires, request a new invitation from the studio administrator.

Sincerely,
Studio Administration | ProNex-ArchAI

Copy invite details template:

ProNex-ArchAI | Studio Invitation
Portal URL: [Portal URL]
Role: [Role]
Username: [Username]
Password setup: [Link issued / link pending]
Note: No password or OTP is included in copied details.

C.3 Design Verification Notification Templates

Admin alert for a new submission:

New Design Verification Request: [Staff Name] uploaded drawing [Drawing Title] for project [Project Name]. Review and sign-off required.

Staff alert when revision is required:

Design Revision Required: [Drawing Title] ([Project Name]). Principal Note: [Feedback Note]. Please update and resubmit.

C.4 Project Explorer and Drawing Rules

- Project cards display Project Code, Project Name, Category, Site Location, Status and Completion %. Project finance fields include Total Project Agreed Fee and Advance Payment Received, subject to role visibility.
- The hybrid DWG strategy preserves the original `.dwg`; where technically feasible, provide a quick high-resolution PDF/vector/image preview. The original DWG download is shown only when current permissions allow it.
- The required file naming convention is `[ProjectName]_[Category]_[SubCategory]_[FileName]`. A filename that does not follow the standard is automatically routed to `03_OTHER`, as specified in the original product requirement.
- After Admin approval, the drawing is available to Staff through the Projects section; the Design Verification item is locked/read-only.

Traceability note: this appendix preserves user-facing content and product details from the supplied source while applying the later security decision that passwords must never be sent or copied in plain text.
